Introduction

The purposes of these exercises are meant to show me the basics of using GitHub, a source code management application that is used widely by developers and organizations. Today's lab helped in showing me in how to create repositories, committing changes, pushing/pulling the changes and collaborating with another person

Exercises

1. Setting Up GitHub Repository for Windows Forms Application

For this exercise, I used the GitHub account I made months ago to create a repository and went along with the steps provided. Though except for step 4, since I was unsure on how I could add an existing project from an empty repository, I had to do the opposite and add my old lab project into the cloned repository. Once that was done, I committed the changes before pushing them up to the repository

2. Creating a Windows Forms Project Repository in Visual Studio and Mapping to GitHub

For this exercise, I created a window form project and initialized a repository to create a local Git repository within my laptop. Then I created another repository and mapped the local rep to the one I created on GitHub before committing and pushing the changes up to the repository

3. Two students to collaborate on a Windows Forms project using GitHub

For the final exercise, I collaborated with Trần Minh Nghĩa – 524K0032 to help me perform this exercise. I was the student A in this exercise by making the repository, the window forms, the initial push, pulling, committing and pushing new changes while Nghĩa was the student B doing the same and resolving the conflicts.

Conclusion

Overall, this lab had been a massive help in helping me understand Source Code Management by using GitHub. The lab was an interesting experience since it focused on using new technology, instead of the usual writing codes that other labs do. The most difficult challenges were trying to get around the errors that appeared in earlier parts of the exercises, like using .gitignore to not push the .vs folder and having to delete some repositories that were set up improperly
